Rain Gardens

A Stormwater Best Management Practice
Keeping Pollution Out of the South River

Stormwater is a serious problem in the South River and Chesapeake Bay watersheds. Stormwater runoff occurs when precipitation from rain or snowmelt flows over impervious surfaces like driveways, parking lots, and roads. These surfaces prevent stormwater runoff from naturally soaking into the ground. As water flows over these impervious surfaces, it picks up debris, fertilizers, oil, and other pollutants and carries them into local waterways. Depressions in the landscape, such as this rain garden, soak stormwater into the ground and reduce runoff.

This rain garden, with its mixture of sand and organic matter, planted with native plants, absorbs the first flush of rainwater that contains the greatest amount of pollutants. The pollutants go into the ground where they are broken down by microbes and the plants instead of the South River.

With support from the Hillmore Shores Improvement Association, what was a source of pollution to the river has now been converted into a beautiful, functional best management practice that contributes cooler, cleaner water to the South River.

The South River Federation is working diligently with local partners, including Hillmore Shores and The Key School - who helps maintain the garden - to reduce stormwater runoff from entering local creeks and the South River in an effort to improve water quality for the entire ecosystem and to protect human health.

This project was made possible by grants from the Chesapeake Bay Trust and Unity Gardens, funding from Hillmore Shores, and with support from the South River Federation.

Plant Choices
Choose native plants

Soil Amendments
40% sand, 20% topsoil,
and 30% compost

Depth
8 to 9 inches deep
to assure water will
infiltrate quickly

Size
2% to 12% the size of
the impervious surface
to be treated

Stormwater is the fastest growing source of pollution to our local streams and the Chesapeake Bay. This rain garden, built by county youth in the READY program, acts like a native forest by collecting, absorbing and filtering the stormwater coming off roofs, driveways, sidewalks and patios. Compared to a conventional lawn, rain gardens reduce runoff by allowing 30% more water to soak into the ground. The garden also protects our waterways by removing almost 90% of the nutrients and chemicals, and 80% of the sediment carried in stormwater runoff.

POLLUTION SOLUTIONS: Case Stories from the Chesapeake

The Chesapeake Bay's clean-up is about more than the science of pollution – it is a story of community. People across the watershed are coming together to change the landscape and make a difference. With threats to fragile habitats, public health, and the Bay's multi-billion dollar fishery and seafood industry, this iconic restoration effort remains a regional and national priority. The Maryland League of Conservation Voters Education Fund, through its "Pollution Solutions" initiative, showcases how clean water funds are being used to keep our waterways healthy, beautiful, and economically viable. The map below highlights some of the region's best projects, showcasing how communities and local governments can work together to solve big problems like polluted runoff.

What is polluted runoff?

Parts of the Chesapeake Bay watershed contain a high percentage of impervious cover – paved or other hard surfaces such as roofs and roadways that prevent rain water from being absorbed into the ground. Instead, water runs along these surfaces, collecting trash and substances such as motor oil, lawn fertilizers, and pesticides. This polluted stormwater flows into streams and rivers, where it threatens aquatic ecosystems and public health.

Effective stormwater management, on the other hand, creates safe paths for polluted runoff to be captured and filtered through the ground before it reaches waterways. This helps keep the environment clean and our communities healthy!

A ribbon cutting at the completion ceremony. Photo credit: Interfaith Partners of the Chesapeake.

A rain garden that will clean thousands of gallons of polluted runoff. Photo credit: Interfaith Partners of the Chesapeake.

Project location: Forestville, MD

Problem: The New Redeemer Church in Forestville was prone to flooding and erosion due to poorly-managed stormwater.

Solution: New Redeemer Church was selected to be a model demonstration site as part of the Prince George's County Clean Water Partnership, an ambitious public-private partnership that will invest \$100 million over 10 years to retrofit more than 2,000 acres of impervious surfaces with green infrastructure throughout the county. Water control features installed at New Redeemer include pervious parking pavers, cisterns to hold rainwater and release it slowly over time, and infiltration trenches and rain gardens to slow and filter polluted runoff.

Key project facts

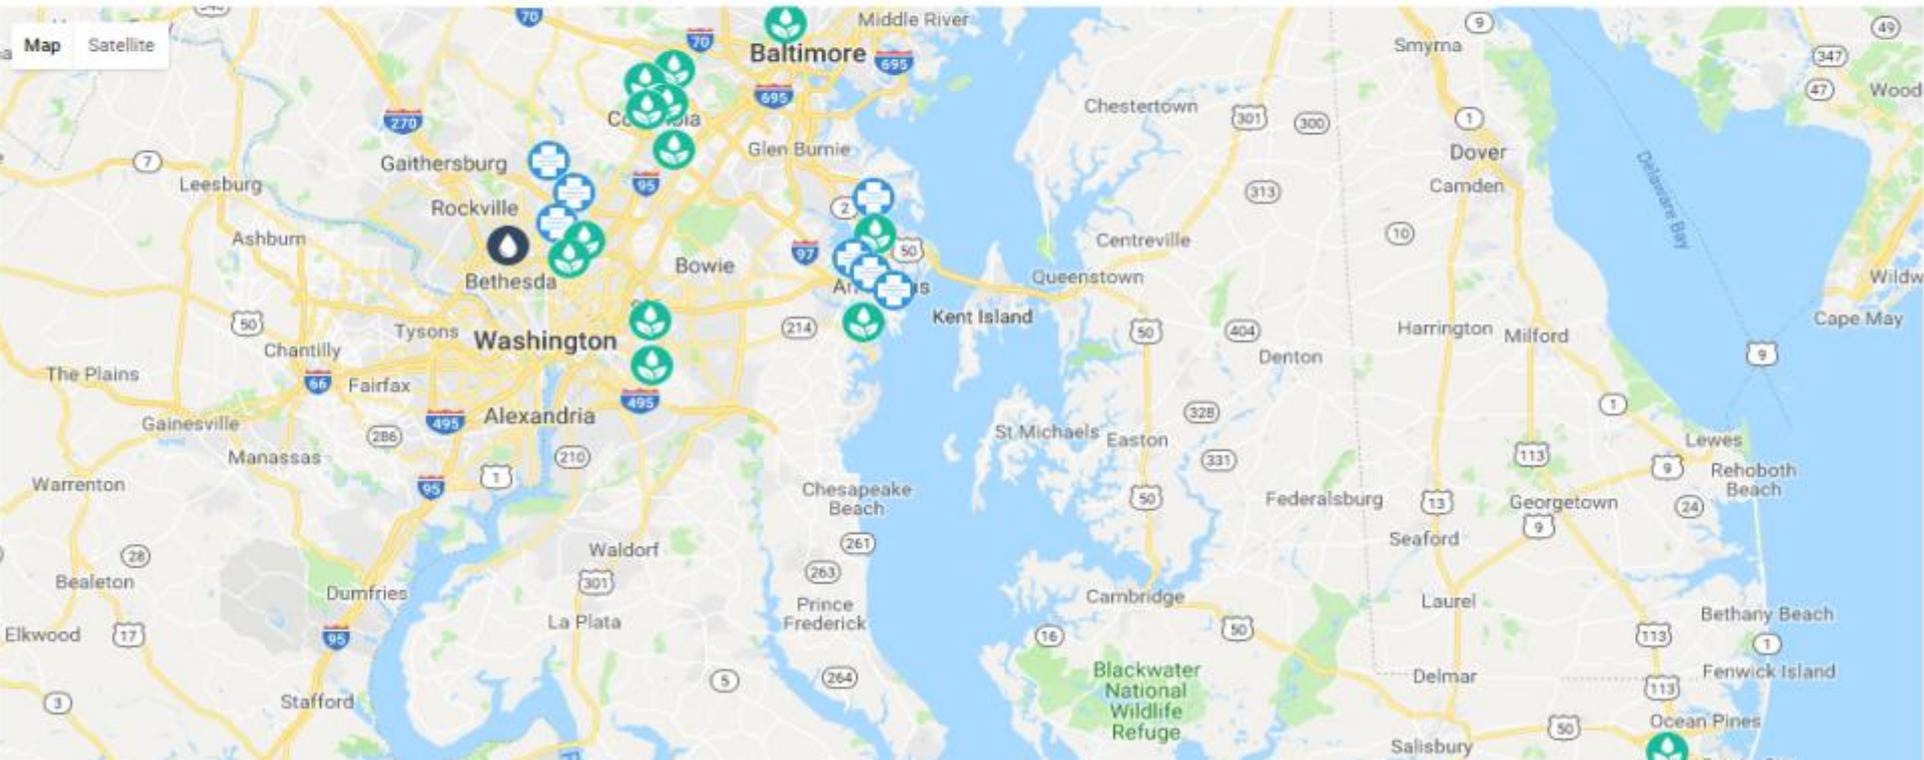

Project Type: Bioretention
Scale: \$100,000 - \$249,999

Pollution Solutions (Stormwater Success Stories)

Page 1 of 9

Thank you for your assistance in spreading the word of how stormwater projects are helping our region reach its clean water goals! Your project is an important example for our communities and lawmakers, and we thank you for sharing the details with us!

The data will be transcribed into concise, engaging marketing pieces about successful polluted runoff projects installed in Chesapeake Bay area communities. Ideal projects might have some of the following elements:

- Accompanied by visually-compelling photographs
- Tell some sort of compelling story
- Funded by polluted runoff fees and/or innovative public-private partnerships
- Located in communities of color and/or underserved communities
- Demonstrating clear benefit to people, communities, and/or natural resources

Photos, Logos, Captions & Credits

Please include a few good quality/high-resolution photos of the project, and provide photo credit information below. Also include your logo if you wish to have it added to the marketing materials that will be generated.

Here are some examples of target photographs wanted:

- Before pictures - Particularly ones that show problems such as flooding or erosion.
- After pictures - Particularly ones that show a big contrast to the before pictures that look beautiful and may include smiling faces.
- A human element - smiling faces, community involvement, kids, etc.
- Pictures after the project are established (for projects completed in previous years.)

Please provide credits and captions here, labeled Photo #1, Photo #2, Report ...etc.

Winchester on the Severn Community Raingarden

mostcenter.org/casestories

Problem:

Winchester on the Severn is a residential neighborhood north of Annapolis. In one section of the community, an old stormwater conveyance system was failing, with water flows scouring the nearby hillside and polluted runoff impairing Chase Creek, a tributary of the Severn River.

Solution:

Members of the community came together to seek a solution. The result was the installation of a rain garden consisting of native plantings. The garden has mitigated stormwater flows, reduced erosion, attracted butterflies, and improved the aesthetics of the area. Aware of the garden's water quality benefits, community members are committed to conducting ongoing maintenance.

BEFORE: the rain garden, street flooding was common and muddy. Photo Credit: Eloise Ullman

AFTER: The newly installed rain garden is beautiful and keeps water off the streets away from the Bay!

Key Project Facts

Type of Project: Bioretention

Cost: \$8,000

Scale: 500 square feet

Funding Sources: Chesapeake Bay Trust; Severn RiverKeeper; Unity Gardens; Winchester on the Severn residential community

Partners: Severn Grove Construction (installation) Winchester on the Severn community members (cleanup days to maintain plantings), Mel Wilkins from Spa Creek Conservancy (site design).

Contact: Eloise Ullman 410-757-1966

What is Polluted Runoff?

The growth of our cities has resulted in too many paved surfaces, which prevent rain water from being absorbed by the ground. Instead, the water runs off streets and buildings, collecting trash and dangerous chemicals on its way. This contaminated water overflows into our streams and rivers, creating public health hazards and toxic waters.

Storm water projects create safe paths for polluted runoff to be captured and filtered before it reaches our waterways. They keep communities healthy and the environment clean.

When communities and their local governments work together to solve big problems like stormwater runoff, that's a story worth telling!

READY Program

■ Problem:

There are few opportunities for youth to earn money and acquire job skills in today's competitive job market. Local jurisdictions are also interested in economical ways to meet water quality goals.

■ Solution:

Restoring the Environment and Developing Youth (READY) is a program working to create green jobs for young adults (16 to 24 years old) while improving watershed health through the reduction of stormwater runoff. Using municipal county grants designated for stormwater management projects, READY provides high school and college students with paid summer jobs, while simultaneously helping the county meet its water quality goals.

READY provides a formal training program for its employees, and many youth have continued to work after high school graduation, earning up to \$16/hour as crew leaders. READY also employs eight full-time, year-round staff.

The Parks & People Program partnered with READY to review the effectiveness of its installations, monitor pollution reductions, and replicate successful Green jobs programs throughout the region.

Photo Credit: Green For All, READY

A READY team at work.

Key Project Facts

Cost per Average Rain Garden: \$13.26/SQ FT including labor and materials

Average Time Required to Install: 4.75 work days for crew of 6 plus a team leader

The Funding Sources: County stormwater fees, grants from the Chesapeake Bay Program and other Bay area funders as administered by the Alliance for the Chesapeake Bay.

The Partners: People Acting Together for Howard County (PATH), The Alliance for the Chesapeake Bay, Howard County, Parks & People, University of MD Sea Grant Extension.

Contact: Lori Lilly, Alliance for the Chesapeake Bay 503-791-8405 Email: llilly@allianceforthebay.org

Breewood Stream Restoration

mostcenter.org/casestories

Problem:

Breewood Stream receives most of its flow from four storm drains that convey stormwater runoff from surrounding neighborhoods. Flowing unmitigated into the creek, stormwater was eroding the streambanks and carrying pollutants such as pesticides and fertilizers. In addition, Breewood Stream suffered from exposed sewer lines and fish passage blockages along its length.

Solution:

Montgomery County stormwater fee proceeds enabled this stream to be restored. The project included stream channel reconstruction and vegetative plantings (trees, shrubs, and meadow grasses). This work was designed to be integrated with the construction of bioretention projects at individual residences nearby and with the county's GreenStreets initiative.

Evidence of erosion prior to restoration

The Stream repaired and restored

Photo credit: Montgomery County Department of Environmental Protection

Key Project Facts

Type of Project: Stream Restoration

Scale: 4470 linear foot stream

Overall Cost: \$800,000

Funding Sources: Montgomery County Stormwater Fees

Monitoring: Ongoing monitoring for several years to provide statistics for other similar projects.
